

Bay Area Scientists in Schools Presentation Plan

Lesson Name Natural Selection in Predators and Prey

Presenter(s) Integrative Biology Graduate Students (Tali Hammond, et al)

Grade Level 3rd

Standards Connection(s) LS: Structure of living things help them grow, survive, and reproduce.
Living things change the environment they live in.

Teaser: Predator-prey relationships are one of the easiest systems through which we can understand natural selection. There is often an "arms race" between predators and prey, in which each species is continually evolving new mechanisms of outsmarting the other. This can lead to interesting adaptations, like camouflage in prey or specialized eating mechanisms in predators. On top of this, environmental conditions play a big role in natural selection. In this lesson, students will model a predator-prey system in two different environments and examine how different variables (environmental color, prey color, predator type, etc.) are involved in natural selection.

Objective: *As a result of your lesson, what will students learn? What will they be able to do?*

Students will learn how camouflage can be an effective mechanism for avoiding predation and how it can evolve, how environment plays a role in natural selection, and how certain predators may be better adapted for catching specific prey species than others. Students will also see how repeating experiments and carefully recording results can allow for reliable and easy analysis.

Vocabulary/Definitions:

3 – 6 important (new) words

- natural selection
- competition
- camouflage
- adaptation
- predator/prey
- species

Materials:

What will you bring with you?

- dark and light colored beans
- plastic forks/spoons
- timer
- index cards/pieces of paper
- 1 large shaggy black and 1 white rug
- a few clear plastic containers
- 2 small white-boards or cardboard sheets to keep score on (or a chalkboard would work)

large print-outs of:

- a cheetah hunting an antelope
- a snake or falcon eating prey
- picture of white and black beads on white and black backgrounds and/or examples of real-life camouflage

What should students have ready? Pencils

Classroom Set-up: *Student grouping, Power/Water, A/V, Light/Dark, set-up/clean-up time needed*
Students should be split into two groups; each of those groups should be split into two groups, students should know which group they're in and preferably already be sitting in the groups.

Classroom Visit

1. Personal Introduction:

1 Minutes

Who are you? What do you want to share with students and why? How will you connect this with students' interests and experiences?

Hi, we're biologists from UC Berkeley. Does anyone know what biologists do? We study the living things around us, and today we've come to talk to you about predators and prey.

Topic Introduction:

5 Minutes

What questions will you ask to learn from students? Big Idea(s), vocabulary, assessing prior knowledge...

Does anyone know what a predator is (focus on the fact that they eat other animals, prey)? Which of these 2 animals is a predator (show picture of cheetah running after prey, or of a cheetah and a separate one of a prey species)? What about these two (show same picture of cheetah and snake/falcon/other type of predator)? Predators come in all shapes and sizes, and they can catch their prey in different ways. Cheetahs use their teeth and claws, falcons use their feet. There are even some birds that have spoon-shaped bills to catch creatures that live in the water. These animals are different species, or types of predators. Cheetahs might be better at hunting antelope, but snakes/falcons might be better at hunting small rodents, and spoonbills would be best at hunting for small, aquatic things. These are adaptations that these animals have evolved over millions of years. Prey can evolve to escape predators, too. (show pictures of camouflaging animals). These animals use camouflage - another adaptation - to hide from predators.

Biologists often use models/simulations to understand and explain what happens in nature. Today we're going to do an experiment to see whether or not camouflage is really an effective adaptation for survival, and to see whether certain predators are better adapted to certain environments and prey types. We're going to pretend to be two species of predators and we're going to pretend that these dark and light colored beans are our delicious prey. One type of predator is going to use their fingers to catch beans, and the other type is going to use a spoon/fork. They're both going to compete for the same food - the beans. Who do you think will be the better bean hunter? What should we name our predator species? (Allow class to pick species names). We're going to split in two now and half of us will work on the dark plot and half on the light plot

2. Learning Experience(s):**35 Minutes**

What will you do, what will kids do? Demonstrations, hands-on activities, images, games, discussion, writing, measuring... Describe in order, including instructions to kids.

1. Take half of class to dark fabric, half to light fabric. For each half, assign half of the group to species A and half to species B and distribute forks appropriately.
2. Show class the beans. Ask: which will be easier to see on the plot (explain camouflage)?; which prey species do we expect to catch more of?; which predator species will have an easier time catching these tiny prey?
3. Explain to group that we're going to play several rounds of this game and that everyone will get a chance to play. Tell them for each round, we'll play until one predator species has "won" and there are none left of the other species. We'll keep score of which predator species wins each round and whether more white or black beans are caught. Show them scoreboard (see below). Pick 4 volunteers, 2 of each species, to start.

ROUND NUMBER	WHICH PREDATOR WON?	WHICH PREY COLOR SURVIVED BEST?
1		
2		
3		
4		

4. Show students the initial prey population (200 beans, half black, half white, in a clear container). Scatter initial prey population.
5. Tell students that they will now be competing for beans and that they'll have 20 seconds to collect beans and the goal is to collect as many as possible. Less than 10 beads means death (leave the plot); 10 or more, survival; 15 or more, 1 offspring. The rounds continue until one of the species dies out.
6. After 20 seconds, stop. Ask who caught more white beans than black beans. Count #beans collected for each student and determine who survives/dies/reproduces. Keep each species' collected beans in a separate beaker. Repeat this process until one species dies off completely. (Add 10 more beans after each 20 second round?)

7. After one species dies off, mark the winner on the scoreboard. Collect beans that remain on the plot and store in a different beaker, labeled “uncaptured beans.” Compare the caught with the leftover container and ask students which prey color we caught more of, and which we caught less of (which survived best). Mark on the sheet.
8. Repeat until all students have gone. After all have gone ask them which predator was a better competitor, and which prey was better at hiding from the predators (surviving)? Ask them why that type of prey had an easier time hiding (should refer to background plot color).

3. Wrap-up: Sharing Experiences

10 Minutes

Putting the pieces together – how will students share learning, interpret experience, build vocabulary?

Have the two halves of the class present their results to each other. Ask the class as a whole which predator species was a better competitor (which one won) and why? Ask why different prey colors survived better on different backgrounds? Show picture of different animals camouflaging to demonstrate.

Define and discuss natural selection with the whole class. Explain that one prey species and one predator species had an advantage, depending on the environment. Explain that the advantage depended on the environmental conditions. Explain that the species who had a better advantage also

4. Connections & Close:

5 Minutes

What else might kids relate this to from their real-life experience? How can they learn more? Thanks and good-bye! Clean-up.

What did you learn today? (we'll bring index cards for kids to write down 3 things they learned, then do questions afterwards)

Total 56 Minutes

Follow-up – After Presentation

Suggest students write a letter explaining “How we learned about camouflage and natural selection...”

Natural Selection – Peppered Moth Activity (pg. 5) from Bioscience for the Future

Reading Connections:

- Where Else in the Wild? By David M. Schwartz and Yael Schy – This volume is ideal for introducing a unit on survival strategies or for extended discovery at a classroom station. The adaptations of both predators and prey are included, so the book can also be used for lessons in food webs, habitats, and life cycles.

<http://www.nsta.org/recommends/ViewProduct.aspx?ProductID=19794>

- Why Are Animals Blue? By Melissa Stewart – The books in the *Rainbow of Animals* series use vibrant colors and fun facts to take readers through the world to explain how color helps creatures survive. Each volume provides a beautiful introduction to animal adaptations using a concept to which children can relate.
